Editorial

This new issue of the Psychology Research Journal addresses different topics beginning with a work that unearths the correlation between the magnitude of risk in relation to socio-demographic variables, preventive actions carried out by the contracting company, the personnel's behaviour and the perception of risk when carrying out work at great heights during operating and maintenance activities for telecommunication towers. The study was carried out in Ecuador and Colombia. The topic is considered one of vital issue as it is a high-risk activity that must be executed quickly and accurately due to the world's constant need to stay communicated through technology.

From another point of view, the second article presents a bibliometric review of the studies published between 2008 and 2018 on the stylistic dimension of field dependence and independence (FID) and its relationship with information processing, memory and attention. In order to identify output and impact indicators and characterize the main findings of the studies found, different publications made in a ten-year interval in the ScienceDirect, Proquest and Scopus databases are analyzed.

The relationship between the Instructional Strategies used by the professor and the participant's cognitive domain in higher education is the subject for the following article. A correlational research was carried out with this objective, through which a postgraduate sample from the National Experimental University of Rafael María Baralt in Maracaibo was researched.

The purpose was to explore the relational incidence between the instructional strategies used by the teacher and the participant's cognitive domain in higher education.

On the other hand, the fourth article investigates the relationship between our unconscious body image and the consumption of aesthetic treatments. This is an interesting topic for which women who consider themselves consumers of aesthetic treatments from the city of Cali (Colombia) participated in. This study has sought to understand the possible relationship between unconscious body image and the consumption of aesthetic treatments.

Mindfulness-based therapies are currently being studied and implemented in the field of substance use disorders.

The following study consisted of a systematic review of literature on the effect of mindfulness-based therapy about substance use disorders.

The study's main goal was to determine the effect of mindfulness-based therapy on substance use disorders according to the literature reviewed.

Lastly, the research on otherness, conflict resolution, and social mediation, arose in the face of aggravated discussions that most often culminate in physical and verbal violence among politically active students in Venezuelan universities. In this paper, the general objective was to analyze the interpersonal relationships of students who are politically active in the FAD-LUZ.
